## J-invariant of an algebraic group

Exposé de Kirill Zainoulline  
(Universität München)

**Résumé :** Let  $G$  be a linear algebraic group over a field  $F$  and  $X$  be a projective homogeneous  $G$ -variety such that  $G$  splits over the function field of  $X$ . We introduce an invariant of  $G$  called  $J$ -invariant which characterizes the splitting properties of the Chow motive of  $X$ . As a main application we obtain a uniform proof of all known motivic decompositions of generically split projective homogeneous varieties (Severi-Brauer varieties, Pfister quadrics, maximal orthogonal Grassmannians,  $G_2$ - and  $F_4$ -varieties) as well as provide new ones (exceptional varieties of types  $E_6$ ,  $E_7$  and  $E_8$ ). We also discuss applications to torsion indices, canonical dimensions and splitting properties of the group  $G$ .
