Comparison of relatively unipotent log-de Rham fundamental groups

Exposé de Bruno Chiarellotto
(Università degli studi di Padova)

Résumé : We investigate, in characteristic 0, the compatibilities of various definitions of relatively unipotent log-de Rham fundamental groups for certain proper log-smooth integral morphisms of log-schemes. All the definitions are algebraic : this will allow us to give a purely algebraic proof of the p-adic good reduction criterium for curves (as given by Andreatta-Iovita-Kim). This is a joint work with Di Proietto and Shiho.
